Discrete fixed−target stability regions in the (k_p, dt) plane

Regions follow from e' = (1 − k_p dt) e: |1 − k_p dt| < 1 iff 0 < k_p dt < 2 (Reduce, exact). The code enforces the stricter monotone region k_p dt <= 1. Valid only for a fixed target, unsaturated control, and no safety projection.

Classification: Symbolically verified under stated assumptions (fixed target, no saturation/projection)
